Description

PML-RAR-alpha DNA Human cDNA differe Lung cancer relate Human RAR-alpha cD

~

The invention relates to an isolated peptide of a novel human nuclear hormone receptor with a fully defined sequence of 457 amino acids given in the specification. The novel human nuclear hormone receptor peptides and nucleic acids encoding them can be used as models for the development of human therapeutic cof human therapeutic targets, aid in the identification of therapeutic of human therapeutic cof human therapeutic cof human therapeutic cofficients, and stryers for the development of human therapeutic agents that modulate nuclear hormone receptor activity in cells and tissues that express the nuclear hormone receptor. The nucleic acids may be used as a query sequence to perform searches against sequence of databases to identify family members or related sequences, as probes or primers, to construct recombinant vectors, to identify compounds that modulate nuclear hormone receptor nucleic acid expression, in gene therapy, and as antisense constructs to control nuclear hormone receptor constructs to control nuclear hormone response, as a reagent in used to raise antibodies or to elicit an immune response, as reagent in assays designed to determine protein levels in biological fluids, as constructly a binding partner/ligand to develop a system for the identify abinding reaction, in drug screening assays, and to identify compounds that modulate protein in drug screening protein receptor construct reverse to the human nuclear construction of the human nuclear construction of the human nuclear construction in the human nuclear construction in the protein construction of the nuclear construction in the nuclear construction is expressed. New human nuclear hormone receptor proteins and nucleic acids, useful as models or targets for developing human therapeutic targets, and in identifying therapeutic proteins and modulators of nuclear hormone protein of the invention Claim 1; Fig 1; 73pp; English. New human nuclear hormone expression P-PSDB; AA021489 hormone receptor receptor

                                                                                                                                                                                                                                       (RAR)-alpha and myl which is characteristic of acute promyelocytic leukemia (APL). This is caused by a translocation of a portion of the long arm of chromosome 15 onto the long arm of chromosome 15 (t(15;17)(q21;q11-22)]. The breakpoint region has been cloned and has been shown that DNA rearrangements are clustered in the region of the first intron of RAR-alpha. This sequence was isolated by polymerase chain reaction (PCR) using primers which correspond to sequences both 5' and 3' to the breakpoint region.

The present sequence represents an oncogene from the present invention. The present invention describes a composition which comprises two antisense oligonuclectides. The first oligonuclectide is specific for a cytoplasmic oncogene or proto-oncogene selected from ras, raf. EGF-1, c-fms, c-ros, c-kit, c-met, c-trk, c-src, c-abl, bcr-abl, c-fgr and c-yes. The second oligonucleotide is specific for a nuclear oncogene or proto-oncogene selected from myc, jun, c-ets, c-fos, c-myb, B-myb, c-rel, c-vav, c-ski, c-spi, cyclin Dl, PML/RAR alpha, MLLI/MTG8, E2A/prl and ALL-1/AF-4. The composition is used for treating cancer. The combination of antisense oligonucleotides has synergistically enhanced ability to inhibit growth of cancer cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   1429

This sequence encodes a human myl/RAR-alpha (retinoic acid receptor alpha) fusion protein which is used in a method for identifying a subject with acute promyelocytic leukaemia (APL) resulting from a t(15.17) translocation who will respond to treatment with all-trans retinoic acid. The protein can also be used to identify a subject with indications of APL who will not respond to treatment with all-trans
                                                                                                                                    1309
                                                                                                                                                                                                    1429

The invention relates to modified human RNAse P external guide sequences (EGSs). The EGS is a ribozyme which forms the catalytic domain of the cribonucleoproteal RNAse P, which is involved in the processing of tRNA. The EGS comprises a cleavage targetting sequence and a recognition sequence which is complementary to the target RNA sequence. The crecognition arm which acceptor stem and the D stem of tRNA. The A recognition arm solocated at the 3' end of the EGS and the D at the 5' correspond to the aminoacyl acceptor stem and the D stem of tRNA. The A recognition arm is located at the 3' end of the EGS and the D at the 5' correspond to the modified nucleotide or an unmodified invention comprise at least one modified nucleotide or an unmodified deoxyribonucleotide, and the 3' end of the modified EGSs of the consist of the A and D arms, and the T stem and loop can consist of consist of modified The A and D arms, and the T stem and loop can consist of ribonucleotides with 5'-phosphate or 5'-phosphate or 5'-phosphorothioate linkages; or deoxyribonucleotides with 5'-phosphate or 5'-phosphate or 5'- phosphorothioate linkages; or deoxyribonucleotides with 5'-phosphate or 5'-phosphate or 5'- phosphorothioate linkages; or deoxyribonucleotides with 5'-phosphate or 5'-phosphate or 5'- phosphorothioate linkages. EGSs of the invention are used for cleaving a target RNA molecule. The invention discloses EGSs which are targetted conception at langer (HBV) RNA sequences, particularly hepatitis B curface antigen (HBAA) RNA, and EGSs targetted at PML/retinoic acid receptor alpha (RAR-alpha) fusion gene mRNA which is found in the majority of acute promple of the invention. The targetted EGSs used in an exemplification of the invention. The targetted EGSs used in an exemplification of the invention. The PML and the RAR-alpha gene fragments of che fusion gene is generated by a balanced reciprocal chromosomal translocation control procession of the fusion gene is always and procession of the fusion gene of the procession of the fusio
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel modified external guide sequences for eukaryotic RNAse P for cleaving hepatitis viral RNA comprises RNAse P targeting sequence and recognition sequence complementary to targeted sequence in target RNA

PML-RAR-alpha DNA (AAT33259) is associated with acute promyelocytic leukaemia (APL). APL is characterised by a balanced, reciprocal translocation between the long arms of chromosomes 15 and 17. resulting in a fusion of the retinoic acid receptor gene (RAR-alpha and a gene for a putative transcription factor, PML. Methods for treating APL involve the use of ribozymes, external guide sequences and antisense oligonuclectices (see also AAT33245 and AAT33245.) the Specifically cleave the PML-RAR-alpha fusion mRNA (see also AAT33251) but not wild-type RAR-alpha mRNA. Plasmids carrying portions of the PML-RAR-alpha genes (see also AAT33260) allow synthesis of shortened versions of APL mRNA in vitro, facilitating testing and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          2084

The invention relates to detecting (MI) granulocyte (GC) activation (GCA), by detecting the level of expression of gene(s) (GS) identified by DNA chip analysis as given in the specification, and comparing the expression level to an expression level in an unactivated the expression level to an expression of GS is indicative of GCA.

CG, where differential expression of GS is indicative of GCA.

CG Also included are modulating (MZ) GA by contecting GC with an agent that alters the expression of at least one gene in GS; (2) screening (M3) content of GCA or an agent capable of modulating GCA or an inflammation (especially CCA or an agent capable of modulating GCA or an inflammation (especially CCA or an agent capable of modulating GCA or an inflammation (especially chronic) in a tissue, an allergic response in a subject, exposure of a subject to a pathogen or sterile inflammatory disease, by detecting the CCA or an altergic response in a subject, exposure of a subject to a pathogen or sterile inflammaton; or in a tissue, an allergic response in a subject, exposure of a subject to a pathogen or sterile inflammatory disease, by contacting a tissue having or sterile inflammatory disease, by contacting a tissue having inflammation with an agent that modulates the expression of gene(s) from GS, where inflammation with an agent that modulates the expression of gene(s) from GS in the tissue. MI is useful for detecting an inflammation in a tissue, an allergic modulating GA; M3 is useful for screening an agent capable of modulating GA preferably in an inflammation in a tissue, an allergic detecting an allergic capable of modulating GA preferably in an inflammation in a tissue, an allergic capable of modulating capable of a subject.

```
Detecting granulocyte activation by detecting differential expression of genes associated with granulocyte activation, which serves as diagnostic markers that is useful for monitoring disease states and drug toxicity
                                                                                                                                                                                                                                    Lry; ARDS;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           758
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                827
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            887
                                                                                                                                                                                                Gaps
response in a subject, exposure of a subject to a pathogen or steril inflammatory disease (e.g. psoriasis, rheumatoid arthritis, glomerulonephritis, asthma, thrombosis, cardiac reperfusion injury, reperfusion injury, and inflammatory bowel disease, crohn's disease, ulcerative colitis, periodontal disease, also bacterial infection, viral infection, parasitic infection, protozoal infection, viral infection and M5 is useful for treating one of the above conditions. The present sequence represents a gene differentially expressed in granulocytes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic.

The present invention describes a method (MI) for screening for an anti-neoplastic agent. The method involves exposing cells to a chemical agent to be tested for anti-neoplastic activity, determining a change in expression of at least one gene (I) of a signature gene set, where (I) comprises a sequence (S) selected from 8447 sequences (given in ABL61664 to ABL70110), or is at least 95% identical to (S), where a change in expression is indicative of anti-neoplastic activity. (I) has cytostatic activity and can be used in gene therapy. MI can be used for screening an anti-neoplastic agent, and can be used for producing a product which is the data collected with respect to the anti-neoplastic agent as a result of MI, and the data is sufficient to convey the chemical structure and/or properties of the agent. MI can be used in the treatment of cancer such as colon, breast, stomach, lung, thyroid, adenocarcinoma, carcinoma, clear cell cancer, infiltrating ductal cancer, infiltrating ductal cancer, infiltrating ductal cancer, infiltrating lobular cancer, squamous cell cancinoma, neuroendocrine
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          CGAGCAGCACCATGACCTTCTCGGACGGCTCACCCTGAACCGGACCCAGATGCACA 1007

This sequence encodes the human retinoic acid receptor alpha, RAR-alpha which is used in a method for identifying a subject with acute promyelocytic leukaemia (APL) resulting from a t(15:17) translocation who will respond to treatment with all-trans retinoic acid. The protein can also be used to identify a subject with indications of APL who will not respond to treatment with all-trans retinoic acid.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ô

                                                                                                                                                             leukaemia (APL). APL is characterised by a balanced and reciprocal translocation between the long arms of chromosomes 15 and 17, resulting in a fusion of the retinoic acid receptor gene (RAR-alpha, see also AAT33260) and a gene for a putative transcription factor, PML. Méthods for treating APL involve the use of ribozymes, external guide sequences and antisense oligonucleotides (see also AAT33245 and AAT33248-57) that specificleave the PML-RAR-alpha fusion mRNA (see also AAT33251) but not wild-type RAR-alpha mRNA.
                                                                                                                                                                                                                                                                                                          DB 17; Length 3511;
                                                                                                                                                                                                                                                                                                                               ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The sequence given represents the nucleic acid sequence of the retinoic acid receptor (RAR) alpha gene. This gene is disrupted in a translocation of a portion of the long arm of chromosome 17 onto the long arm of chromosome 15 [t(15;17)(q21;q11-22)]. This causes a fusion between RAR-alpha and myl which is characteristic of acute promyelocytic leukemia (APL). The breakpoint region has been cloned and it has been shown that DNA Rearrangements are clustered in the region of the first intron of RAR-alpha. This sequence was isolated by polymerase chain reaction (PCR). The primers used for amplification of this sequence can also be used to amplify the translocated region.
                                                                                                                                                                                               Retinoic acid receptor; RAR-alpha; myl; acute promyelocytic leukemia; APL; translocation; chromosome 17; chromosome 15; PCR; primer; [t(15;17)(q21;q11-22)]; breakpoint; polymerase chain reaction; ss.

The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) are useful for treating

7:
disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. AAS64197-AAS94564 represent novel human diagnostic coding sequences of the invention.

Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ŏ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          g
                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polypeptide (II) sequences. (I) is useful as hybridisation probes, and gene mapping, and in recombinant production of (II). The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques of restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating cisorders involving aberrant protein expression or biological activity. (The polypeptide and polynucleotide sequences have applications in cidagnostics, forensics, gene mapping, identification of mutations conditions of an appear in the produce other types of data and products dependent on DNA and adaptostic coding sequences of the invention.

Conditional sequences of the invention of mutations coding sequences of the invention but as seasons because of the invention of specification, but was obtained in electronic format directly from WIPO continuations.

Pred. No. is the number of results predicted by chance to have a

score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
